## Fidgets for the Future

Fidget toys were one of the top 10 trending toys in 2017. “Fidgets” (toys and devices to make fidgeting more effective and entertaining) have practical uses for adults and children.

Studies have shown that fidgeting with an object helps individuals stay focused when doing a long task or sitting still and attentive for long periods of time. They have been proven to assist with conditions like ADD, ADHD, autism and anxiety.

### Inside this Issue:

Fidgets for the Future	1-2, 10-11
ATM - MarketPlace	3 – 8

iCanConnect-Oregon	12

### Improve attention with a fidget

An effective fidget doesn't distract you from your primary task because it is something you shouldn't have to think about. If you have ever clicked a pen repeatedly, tapped it on a desk, or played with a ring you were wearing, you have used a fidget device. Other examples of fidgeting include tapping your foot, bouncing your knee or touching each finger to your thumb repeatedly – you might benefit from a fidget!

What to look for when considering a fidget?

- Quality – it will get frequent, repetitive use.
- Texture and Feel – light-weight, moving parts, should be soothing.
- Entertaining - but not distracting (annoying sounds/colors), should be an outlet for excess energy.

Many times, fidget toys go hand-in-hand with sensory toys. There are a number of fidgets commercially available that target all age groups. Inclusive kits are available online containing many of the ones featured below.

Pop Its are the newest fidget toy available. It consists of a silicone sheet of dimples that the user pushes back and forth, similar to bubble wrap. Pop Its can be used by either popping the bubbles back and forth or pressing all of the bubbles down and then flipping it over to start again. They come in several shapes, sizes, and colors and even as keychains.

Mesh Squishy Balls are sometimes marketed as a modern stress ball, which is basically what a fidget is. The user squeezes the liquid-filled gel ball to watch bubbles pop out of the mesh net. Squishy balls are not the only balls for fidgeting. Many other balls are made of foam or are spiky or even bouncy.

Check with your teacher before taking a fidget into your classrooms.

Fidget bars come in many styles and for many uses. They can be attached to a student's desk in the classroom as a bar on a stretchy cord, or a standalone swing bar. They can be used seated or standing and provide an outlet for restless legs.

Fidget spinners are even being incorporated into everyday items like wedding rings and watches. Fidget rings have a center band that rotates or spins around the stationary band. Another form is multiple interlocking bands, or rings that come apart like puzzle pieces, or rings with moveable pieces such as beads or adornments.

The Pokémon Spinning Analog Watch which has a fidget spinner attached to the top of a metal cover with a spring hinge to keep it closed when spinning. Opening the lid reveals the watch face. Other versions feature an outer bezel that rotates around an open watch face.

**(Fidgets - continued from page 2)**

The Squidget is a small light weight fidget that is designed to attach to the end of a pen or pencil. It is designed to address several of the most common fidgeting documented such as button spinning, pen rolling, (hair) twirling, and rubbing textures. Each side of the cube features a different element.

An Infinity Cube is a mathematical puzzle toy that consists of 8 blocks attached together that can be folded around and on top of each other. It can be opened and arranged in different shapes and from different directions creating an interesting visual effect. Infinity Cubes can even be used one handed.

Magnetic sculptures use a magnetic base and non-magnetic media to create moldable sculptures. The media can be shapes (such as balls, stars, moons), letters or objects like snowflakes, people or nuts and bolts.

Twiddle Muffs are machine washable fidgets designed for individuals with dementia. There is a stuffed dog and cat version, or a sport version with plaid fabric. They feature gadgets such as ribbons, wooden beads, pockets, Velcro and a squeezable ball to keep restless hands busy. Restless hands are common if the individual performed manual tasks with their hands before the onset of dementia.

Finger Fidget Stones are discrete natural-colored stones that provide a tactile sensory experience. These provide the user with a smooth relaxing experience to relieve anxiety and calm nervous energy. They come in packs of 12 with three shapes: heart, knobby and hollowed.

Rubik's Snake (also Rubik's Twist or Rubik's Snake Puzzle) is a mechanical toy made of triangular prisms that can rotate freely (but not come apart) to create an infinite variety of objects and geometric shapes including cubes, triangles, hearts, dogs, turtles, and so much more.

Applications (apps) such as the Sensory Fidget Toys Game! turn a smartphone or tablet into an anti-stress and anti-anxiety device. This app contains virtual fidgets including Pop Its, Fidget Cubes, Magnet and Squish Balls, spinners, gears, slime, and more, for hours of immediate stress relief and focus relaxation.

Fidgets don't have to be costly. DIY and 3D printed fidgets are on the rise. A simple DIY fidget can provide hours of spinning, rolling and more can be made with Binder Rings and Pony Beads. Sand can be placed in an empty balloon and tied off for a quick and easy fidget squeezer. Glitter, distilled water and glue can be added to a water bottle for a calming fidget. The possibilities are endless.

Online 3D printing instruction websites like Instructables and Thingiverse host STL files that act as blueprints for making a wide variety of fidgets. From fidget spinners and rings, to slinkies, widgets and gyroscopes, files are open source and readily available.

Fidgets really do serve a valuable purpose. Researchers are working toward inventing the next generation of fidgets to provide just the right level of stimulation while keeping calm and managing attention.
